**Annual Drinking Water Quality Consumer Confidence
Report for Miami County Bethel Township
Public Water Systems**

PWS ID# OH-5502703

Sanitary Engineer Paul P. Huelskamp, P.E., P.S.
Superintendent Ryan Fine

www.miamicountyohio.gov

INTRODUCTION

Miami County Sanitary Engineering Department (MCSED) has prepared this report to provide information to you, the consumer, on the quality of our drinking water. This report includes general health information, water quality test results, water source and contact information.

GENERAL INFORMATION

Miami County has a current unconditional license to operate its Public Water System issued by the OEPA on January 1, 2025. This report is a requirement of the Safe Drinking Water Act Amendments of 1996.

This water quality report is for the year **2024**.

WATER SOURCE INFORMATION

The Miami County Sanitary Engineering Department serves you with water we purchase from the Clark County, Ohio water plant located at Medway Water Treatment Plant. Clark County obtains its public drinking water supply from buried valley sand and gravel aquifers associated with the Great Miami River. Clark County currently utilizes three (3) production wells to draw water from the aquifer. Well water is pumped to the distribution system and chlorine is added to disinfect the water prior to being pumped to you, the consumer. Miami County water meets or exceeds all the standards that are set forth by the Ohio and United States Environmental Protection Agencies.

SUSCEPTIBILITY ANALYSIS

The Ohio EPA recently completed a susceptibility analysis of the Park Layne PWS source water. The assessment indicates that Park Layne PWS source of drinking water has a high susceptibility to contamination due to: the presence of a relatively thin protective layer of clay overlying the aquifer; a shallow depth (less than 15 feet below ground level) of the water table and the presence of potential contaminant sources in the protection area. This susceptibility means that under current existing conditions, the likelihood of the aquifer becoming contaminated is relatively high. This likelihood can be minimized by implementing appropriate protective measures. This does not mean that the source waters are contaminated, just that they have a high susceptibility to contamination. You can obtain a copy of the complete report by contacting Clark County Sanitary Engineer at 937-521-2150 or the Ohio EPA at 614-644-2752.

ADDITIONAL INFORMATION

For more information on your drinking water please contact Ryan Fine, Water and Wastewater Superintendent at the Miami County Sanitary Engineering Department at 937-440-5653 or visit www.miamicountyohio.gov. Public participation and comments are encouraged by contacting MCSED, or the Board of Miami County Commissioners located in the Miami County Safety Building, Troy, Ohio.

E.P.A REQUIREMENTS

The OEPA requires regular sampling to ensure drinking water safety. Chlorine and bacteria sampling is performed on a regular routine basis, while tests for lead and copper and other contaminants are performed on a specified schedule in accordance with EPA regulations.

WHAT ARE THE SOURCES OF CONTAMINANTS IN DRINKING WATER?

The sources of drinking water, both tap and bottled water, includes rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity; (farming, septic tanks, lawn chemicals, storm runoff, etc.)

Contaminants that may present in source water include: (A) Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; (B) Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharge, oil and gas production, mining, or farming; (C) Pesticides and herbicides, which may come from variety of sources, such as agriculture, urban storm runoff, and residential uses; (D) Organic chemical contaminants, including synthetic, and volatile organic chemicals, which are by products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems; (E) radioactive contaminants, which can be naturally-occurring or be the results of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, USEPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk unless the contaminant level exceeds the MCL established by the USEPA. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Hotline at 1-800-426-4791.

WHO NEEDS TO TAKE SPECIAL PRECAUTIONS?

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* are available from the Safe Drinking Water Hotline at 1-800-426-4791.

LEAD EDUCATION

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Miami County Bethel Township PWS is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. **“Per the Lead and Copper Rules, Public Water Systems were required to develop and maintain a Service Line Inventory. A service line is the underground pipe that supplies your home or building with water. To view the Service Line Inventory, which lists the material type(s) for your location, you can visit [Service Line \(View\)](#).** When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Hotline at 1-800-426-4791 or at <http://www.epa.gov/safewater/lead>.

2024 Water Quality Results for Miami County Bethel Township PWS

TABLE OF DETECTED CONTAMINANTS

Contaminants (Units)	MCLG	MCL	Level Found	Range of Detections	Violation	Sample Year	Typical Source of Contaminants
Disinfectant and Disinfectant By-Products							
Total Chlorine (ppm)	MRDLG = 4	MRDL = 4	1.106658	.829 to 1.1759	No	2024	Water additive used to control microbes
Haloacetic Acids (HAA5) (ppb)	N/A	60	N/A	N/A	yes	2024	By-product of drinking water disinfection
Total Trihalomethanes (TTHM) (ppb)	N/A	80	16	1 to 16	No	2024	By-product of drinking water disinfection
Inorganic Contaminants							
Fluoride (ppm)	4	4	1.05	0.38-1.28	No	2024	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Barium (ppm)	2	2	0.075	0.075	No	2020	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits
Nitrate (ppm)	10	10	4.74	4.74	No	2024	Run off from fertilizer use, Leaching from septic tanks, sewage; Erosion of natural deposits
Lead and Copper							
Contaminants (units)	Action Level (AL)	MCLG	Individual Results over the AL	90% of test levels were less than	Violation	Year Sampled	Typical source of Contaminants
Lead (ppb)	15 ppb	0 ppb	<5	.9-5.1	No	2023	Corrosion of household plumbing systems; erosion of natural deposits
	___ out of ___ samples were found to have lead levels in excess of the lead action level of 15 ppb.						
Copper (ppm)	1.3 ppm	1.3 ppm	0.283	.0718-.283	No	2023	Erosions of natural deposits; leaching from wood preservatives; Corrosions of household plumbing systems

Miami County Water Department was in violation for failing to obtain samples for Haloacetic Acids (HAA5) for the monitoring period between 7/1 and 9/30 of 2024, as required by the Ohio EPA. The water department did pull the sample but due to an accident at the lab the samples were not able to be tested. The water department will return to compliance when samples are collected in the coming month. The water department plans to have these samples completed earlier in the sampling time frame so that if any issue with the samples arises, we can resample within the time frame set by Ohio EPA.

Haloacetic acids (HAA5) are groups of disinfection byproducts that form when water disinfectants react with other naturally occurring chemicals in the water.

There have been many studies on the health effects of exposure to disinfection byproducts. Although some studies indicate the potential for both short- and long-term adverse health effects, others do not. There is still a lot of uncertainty regarding an individual's risk when exposed to levels of disinfection byproducts above the maximum contaminant level. The Miami County water systems supplied water from neighboring entities that also test these disinfectants, and all have met the EPA standards for safe drinking water. With these results we feel that the water we are supplying is safe. For more information, call Ohio EPA's Division of Drinking and Ground Waters at (614) 644-2752. Any questions for Miami County please contact Ryan Fine Water/Wastewater Superintendent at (937)440-5653

Sincerely,

A handwritten signature in black ink, appearing to read "Ryan Fine". The signature is written in a cursive style with a large initial "R" and "F".

Superintendent Ryan Fine

www.miamicountyohio.gov

INTRODUCTION

Miami County Sanitary Engineering Department (MCSED) has prepared this report to provide information to you, the consumer, on the quality of our drinking water. This report includes general health information, water quality test results, water source and contact information.

GENERAL INFORMATION

Miami County has a current unconditional license to operate its Public Water System issued by the OEPA on January 1, 2025. This report is a requirement of the Safe Drinking Water Act Amendments of 1996.

This water quality report is for the year **2024**.

WATER SOURCE INFORMATION

The Miami County Sanitary Engineering Department serves you with water we purchase from the City of Troy, Ohio water plant located at 300 E. Staunton Street. Troy obtains its public drinking water supply from buried valley sand and gravel aquifers associated with the Great Miami River. Troy currently utilizes ten (10) production wells to draw water from the aquifer for treatment at the water plant. Well water is pumped to the water treatment plant where it is softened, clarified, disinfected and filtered, prior to being pumped to you, the consumer. Miami County water meets or exceeds all the standards that are set forth by the Ohio and United States Environmental Protection Agencies.

SUSCEPTIBILITY ANALYSIS

A susceptibility analysis was completed by the City of Troy. It found that the well field is located above a buried aquifer which provides limited natural protection from contaminants infiltrating into the aquifer. Because of this setting, the aquifer that supplies drinking water to the City of Troy is considered to be susceptible to contamination. The City has developed a comprehensive wellhead protection program to manage potential sources of contamination in the protection area to minimize any impacts to the aquifer. You can obtain a copy of the complete report by contacting City of Troy Water Plant 937-339-4826.

ADDITIONAL INFORMATION

For more information on your drinking water please contact Ryan Fine, Water and Wastewater Superintendent at the Miami County Sanitary Engineering Department at 937-440-5653 or visit www.miamicountyohio.gov. Public participation and comments are encouraged by contacting MCSED, or the Board of Miami County Commissioners located in the Miami County Safety Building, Troy, Ohio.

E.P.A REQUIREMENTS

The OEPA requires regular sampling to ensure drinking water safety. Chlorine and bacteria sampling is performed on a regular routine basis, while tests for lead and copper and other contaminants are performed on a specified schedule in accordance with EPA regulations.

WHAT ARE THE SOURCES OF CONTAMINANTS IN DRINKING WATER?

The sources of drinking water, both tap and bottled water, includes rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity; (farming, septic tanks, lawn chemicals, storm runoff, etc.)

Contaminants that may present in source water include: (A) Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; (B) Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharge, oil and gas production, mining, or farming; (C) Pesticides and herbicides, which may come from organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems; (D) Organic chemical contaminants, including synthetic, and volatile organic chemicals, which are by products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems; (E) radioactive contaminants, which can be naturally-occurring or be the results of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, USEPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk unless the contaminant level exceeds the MCL established by the USEPA. INTRODUCTION

Miami County Sanitary Engineering Department (MCSED) has prepared this report to provide information to you, the consumer, on the quality of our drinking water. This report includes general health information, water quality test results, water source and contact information.

GENERAL INFORMATION

Miami County has a current unconditional license to operate its Public Water System issued by the OEPA on January 1, 2025. This report is a requirement of the Safe Drinking Water Act Amendments of 1996.

This water quality report is for the year **2024**.

WATER SOURCE INFORMATION

The Miami County Sanitary Engineering Department serves you with water we purchase from the NAWA Tipp City, Ohio water plant located at 525 S. 1st Street, Tipp City, Ohio. NAWA obtains its public drinking water supply from buried valley sand and gravel aquifers associated with the Great Miami River. NAWA currently utilizes six (6) production wells to draw water from the aquifer for treatment at the water plant. Well water is pumped to the water treatment plant where it runs through sand filters for Iron and Manganese. Nano filtration membranes are used for the reduction or removal of hardness, viruses and other contaminants. Chlorine is added for disinfection. Fluoride is added for dental health and Orthophosphate is added to minimize corrosion and scaling in the distribution system. Miami County water meets or exceeds all the standards that are set forth by the Ohio and United States Environmental Protection Agencies.

SUSCEPTIBILITY ANALYSIS

A susceptibility analysis was completed by NAWA. The assessment indicates that NAWA's source of drinking water has a high susceptibility to contamination due to the: Lack of a protective layer of clay overlying the aquifer; a shallow depth (less than 20 feet below ground surface) of the aquifer.; Presence of significant potential contaminant sources in the protection area; and the presence of manmade contaminants in treated water. Nitrates have been detected in NAWA's source of drinking water at concentrations above concern. The risk of future contamination can be minimized by implementing appropriate protective measures. This does not mean that the source waters are contaminated, just that they have a high susceptibility to contamination. You can obtain a copy of the complete report by contacting NAWA at 937-667-1890.

ADDITIONAL INFORMATION

For more information on your drinking water please contact Ryan Fine, Water and Wastewater Superintendent at the Miami County Sanitary Engineering Department at 937-440-5653 or visit www.miamicountyohio.gov. Public participation and comments are encouraged by contacting MCSED, or the Board of Miami County Commissioners located in the Miami County Safety Building, Troy, Ohio.

E.P.A REQUIREMENTS

The OEPA requires regular sampling to ensure drinking water safety. Chlorine and bacteria sampling is performed on a regular routine basis, while tests for lead and copper and other contaminants are performed on a specified schedule in accordance with EPA regulations.

WHAT ARE THE SOURCES OF CONTAMINANTS IN DRINKING WATER?

The sources of drinking water, both tap and bottled water, includes rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity; (farming, septic tanks, lawn chemicals, storm runoff, etc.)

Contaminants that may present in source water include: (A) Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; (B) Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharge, oil and gas production, mining, or farming; (C) Pesticides and herbicides, which may come from organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems; (D) Organic chemical contaminants, including synthetic, and volatile organic chemicals, which are by products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems; (E) radioactive contaminants, which can be naturally-occurring or be the results of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, USEPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk unless the contaminant level exceeds the MCL established by the USEPA. **Annual Drinking Water Quality Consumer Confidence
Report for Monroe Township
Public Water Systems**

PWS ID# OH-5553614

District President Scott Vagedes

www.mtwsd.com

INTRODUCTION

Monroe Township Water and Sewer District has prepared this report to provide information to you, the consumer, on the quality of our drinking water. This report includes general health information, water quality test results, water source and contact information.

GENERAL INFORMATION

Monroe Township Water and Sewer District has a current unconditional license to operate its Public Water System issued by the OEPA on January 1, 2025. This report is a requirement of the Safe Drinking Water Act Amendments of 1996.

This water quality report is for the year **2024**

WATER SOURCE INFORMATION

The Monroe Township Water and Sewer District serves you with water we purchase from the NAWA Tipp City, Ohio water plant located at 525 S. 1st Street, Tipp City, Ohio. NAWA obtains its public drinking water supply from buried valley sand and gravel aquifers associated with the Great Miami River. NAWA currently utilizes six (6) production wells to draw water from the aquifer for treatment at the water plant. Well water is pumped to the water treatment plant where it runs through sand filters for Iron and Manganese. Nano filtration membranes are used for the reduction or removal of hardness, viruses and other contaminants. Chlorine is added for disinfection. Fluoride is added for dental health and Orthophosphate is added to minimize corrosion and scaling prior to being pumped to you, the consumer. Monroe Township water meets or exceeds all the standards that are set forth by the Ohio and United States Environmental Protection Agencies.

SUSCEPTIBILITY ANALYSIS

A susceptibility analysis was completed by NAWA. The assessment indicates that NAWA's source of drinking water has a high susceptibility to contamination due to the: Lack of a protective layer of clay overlying the aquifer; a shallow depth (less than 20 feet below ground surface) of the aquifer.; Presence of significant potential contaminant sources in the protection area; and the presence of manmade contaminants in treated water. Nitrates have been detected in NAWA's source of drinking water at concentrations above concern. The risk of future contamination can be minimized by implementing appropriate protective measures. This does not mean that the source waters are contaminated, just that they have a high susceptibility to contamination. You can obtain a copy of the complete report by contacting NAWA at 937-667-1890.

ADDITIONAL INFORMATION

For more information on your drinking water please contact Scott Vagedes, District President at the Monroe Township Water and Sewer District at 937-667-7242 or visit www.miamicountyohio.gov. Public participation and comments are encouraged by contacting Monroe Township Water and Sewer District.

E.P.A REQUIREMENTS

The OEPA requires regular sampling to ensure drinking water safety. Chlorine and bacteria sampling is performed on a regular routine basis, while tests for lead and copper and other contaminants are performed on a specified schedule in accordance with EPA regulations.

WHAT ARE THE SOURCES OF CONTAMINANTS IN DRINKING WATER?

The sources of drinking water, both tap and bottled water, includes rivers, lakes, streams, ponds, reservoirs, springs and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity; (farming, septic tanks, lawn chemicals, storm runoff, etc.)

Contaminants that may present in source water include: (A) Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife; (B) Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharge, oil and gas production, mining, or farming; (C) Pesticides and herbicides, which may come from organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems; (D) Organic chemical contaminants, including synthetic, and volatile organic chemicals, which are by products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems; (E) radioactive contaminants, which can be naturally-occurring or be the results of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, USEPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. FDA regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk unless the contaminant level exceeds the MCL established by the USEPA. More information about contaminants and potential health effects can be obtained by calling the USEPA's Safe Drinking Hotline at 1-800-426-4791.

WHO NEEDS TO TAKE SPECIAL PRECAUTIONS?

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* are available from the Safe Drinking Water Hotline at 1-800-426-4791.

LEAD EDUCATION

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Monroe Township PWS is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. **“Per the Lead and Copper Rules, Public Water Systems were required to develop and maintain a Service Line Inventory. A service line is the underground pipe that supplies your home or building with water. To view the Service Line Inventory, which lists the material type (s) for your location, you can visit [Service Line \(View\)](#) .**When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Hotline at 1-800-426-4791 or at <http://www.epa.gov/safewater/lead>.

2024 Water Quality Results for Monroe TWP Wayer & Sewer Dist. PWS

TABLE OF DETECTED CONTAMINANTS

Contaminants (Units)	MCLG	MCL	Level Found	Range of Detections	Violation	Sample Year	Typical Source of Contaminants
Disinfectant and Disinfectant By-Products							
Total Chlorine (ppm)	MRDLG = 4	MRDL = 4	1.166767	1.1032 to 1.2419	No	2024	Water additive used to control microbes
Haloacetic Acids (HAA5) (ppb)	N/A	60	NA	Na	yes	2024	By-product of drinking water disinfection
Total Trihalomethanes (TTHM) (ppb)	N/A	80	17	2 to 17	No	2024	By-product of drinking water disinfection
Inorganic Contaminants							
Fluoride (ppm)	4	4	1.2	.82-1.2	No	2024	Erosion of natural deposits; Water additive which promotes strong teeth; Discharge from fertilizer and aluminum factories
Barium (ppm)	2	2	0.07	0.07	No	2024	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits
Nitrate (ppm)	10	10	0.45	0.45	No	2024	Run off from fertilizer use, Leaching from septic tanks, sewage; Erosion of natural deposits
Beryllium ppb	4	4	0.01	0.01	No	2024	Discharge from metal refineries
Nickel ppb	100	100	3.2	3.2	No	2024	Erosion of natural deposits
Lead and Copper							
Contaminants (units)	Action Level (AL)	MCLG	Individual Results over the AL	90% of test levels were less than	Violation	Year Sampled	Typical source of Contaminants
Lead (ppb)	15 ppb	0 ppb	0	0.5 ppb	No	2024	Corrosion of household plumbing systems; erosion of natural deposits
	0 out of _10_ samples were found to have lead levels in excess of the lead action level of 15 ppb.						
Copper (ppm)	1.3 ppm	1.3 ppm	0	.523 ppm	No	2024	Erosions of natural deposits; leaching from wood preservatives; Corrosions of household plumbing systems
	0 out of _10_ samples were found to have copper levels in excess of the copper action level of 1.3 ppm.						

Monroe TWP was in violation for failing to obtain samples for Haloacetic Acids (HAA5) for the monitoring period between 7/1 and 9/30 of 2024, as required by the Ohio EPA. The Miami County water department did pull the sample but due to an accident at the lab the samples were not able to be tested. The water department will return to compliance when samples are collected in the coming month. The water department plans to have these samples completed earlier in the sampling time frame so that if any issue with the samples arises, we can resample within the time frame set by Ohio EPA.

Haloacetic acids (HAA5) are groups of disinfection byproducts that form when water disinfectants react with other naturally occurring chemicals in the water.

There have been many studies on the health effects of exposure to disinfection byproducts. Although some studies indicate the potential for both short- and long-term adverse health effects, others do not. There is still a lot of uncertainty regarding an individual's risk when exposed to levels of disinfection byproducts above the maximum contaminant level. The Monroe Township water system is supplied water from Tipp City that also test these disinfectants, and all have met the EPA standards for safe drinking water. With these results we feel that the water we are supplying is safe. For more information, call Ohio EPA's Division of Drinking and Ground Waters at (614) 644-2752. Any questions for Monroe Township please call (937)667-3136 or Miami County Ryan Fine Water/Wastewater Superintendent at (937)440-5653

Sincerely,

INTRODUCTION

Miami County Sanitary Engineering Department (MCSED) has prepared this report to provide information to you, the consumer, on the quality of our drinking water. This report includes general health information, water quality test results, water source and contact information.

GENERAL INFORMATION

Miami County has a current unconditional license to operate its Public Water System issued by the OEPA on January 1, 2025. This report is a requirement of the Safe Drinking Water Act Amendments of 1996.

This water quality report is for the year **2024**.

WATER SOURCE INFORMATION

The Miami County Sanitary Engineering Department serves you with water we purchase from the City of Troy, Ohio water plant located at 300 E. Staunton Street. Troy obtains its public drinking water supply from buried valley sand and gravel aquifers associated with the Great Miami River. Troy currently utilizes ten (10) production wells to draw water from the aquifer for treatment at the water plant. Well water is pumped to the water treatment plant where it is softened, clarified, disinfected and filtered, prior to being pumped to you, the consumer. Miami County water meets or exceeds all the standards that are set forth by the Ohio and United States Environmental Protection Agencies.

SUSCEPTIBILITY ANALYSIS

A susceptibility analysis was completed by the City of Troy. It found that the well field is located above a buried aquifer which provides limited natural protection from contaminants infiltrating into the aquifer. Because of this setting, the aquifer that supplies drinking water to the City of Troy is considered to be susceptible to contamination. The City has developed a comprehensive wellhead protection program to manage potential sources of contamination in the protection area to minimize any impacts to the aquifer. You can obtain a copy of the complete report by contacting City of Troy Water Plant 937-339-4826.

ADDITIONAL INFORMATION

For more information on your drinking water please contact Ryan Fine, Water and Wastewater Superintendent at the Miami County Sanitary Engineering Department at 937-440-5653 or visit www.miamicountyohio.gov. Public participation and comments are encouraged by contacting MCSED, or the Board of Miami County Commissioners located in the Miami County Safety Building, Troy, Ohio.

E.P.A REQUIREMENTS

The OEPA requires regular sampling to ensure drinking water safety. Chlorine and bacteria sampling is performed on a regular routine basis, while tests for lead and copper and other contaminants are performed on a specified schedule in accordance with EPA regulations.

WHAT ARE THE SOURCES OF CONTAMINANTS IN DRINKING WATER?

The sources of drinking water, both tap and bottled water, includes rivers, lakes, streams, ponds, reservoirs, springs and wells.
